

# My Vision of 2030

By 2030, I envision a world that is very much improved, with greener cities, better schools, and many new ways for people to connect.

I believe that education will be better with the incorporation of artificial intelligence by 2030. Teachers, with the help of advanced AI tools, will be able to teach students with a higher-quality education and reach many more students than ever before. Hybrid classroom models, along with in-person and virtual learning, will make sure that children from remote villages as well as crowded cities have equal access to education.

I believe healthcare will improve too. Using artificial intelligence, one will be able to track her health easily. It would also help alert doctors beforehand in case of serious illnesses. Telemedicine will bring expert care to all alike.

Most importantly, I hope that our society will become more empathetic. I hope that through technology and a little co-operation of our own, we will be able to understand one another better and bridge linguistic and cultural divides. I aspire to do my part by caring for the environment and responsibly using technology to learn new things while respecting its morals.

I believe that by 2030, innovation and compassion will coexist side by side—where every individual has the chance to flourish, engage, and work together towards a better future.

Thank you
