

My Vision of 2030

Imagine waking up in a world where self-driving cars move swiftly avoiding the regular uproar of vehicles, the air is clean, and education goes far beyond the four walls of a regular classroom to a completely virtual medium. 2030, even though may seem very far away, will roll in sooner than you'd expect. According to me, the 2030s will be an era of spotless cities with futuristic robots living alongside humans. The streets would be sparkling clean with no human stepping out of their home. There will be AI-powered self-driven cars driving people around. The metaverse would become a common platform for humans to interact rather than talking face-to-face. The workforce would most likely be taken over by AI powered robots. Humans would get everything with a press of a button. Healthcare would progress enormously with the robots researching and creating new technologies and medicine. Education would not be bound to 4 walls of a classroom. Rather it can be obtained from anywhere in the world by the student with the help of one's mechanical teacher. There will be almost no social interaction amongst humans with children playing online games with one's 'friend' in the metaverse & adults scrolling mindlessly on their gadgets. For my role, I would try to encourage sustainable practices and urge fellow humans to control the use of AI so that it does not become too powerful and possibly, take over the world.
