

## My Vision of 2030

Five years is indeed a long time. Why, in 1876, Alexander Graham Bell made the first phone call, which seemed impossible only a few years before, just as the thought of digital payments would seem like a fantasy before the 1990s!

I hold great expectations and hopes for our world in 2030, which is advancing at a remarkable pace in many fields — technology, healthcare, finance, education and more.

In 2030, I feel that AI would be present everywhere; cities, powered by AI, to manage traffic and safety, self-driven electric cars, robots which use AI to help in daily tasks and chores, AI preventing cyber-attacks, maybe even AI aiding scientists in discovering and inventing; the list is truly endless!

In the vast field of healthcare, robots would further dominate the field of surgeries. Medicines, which would not have any negative effects, would be modified for every person. Quality healthcare would be available to all, rich and poor, men and women, old and young; and hospitals and clinics would be present everywhere, in both urban and rural areas.

These are only a few of the changes I hope and envision. I feel that these advancements would help shape a brighter and more prosperous future for our world, where today's fantasy is tomorrow's reality!
