

MY VISION OF 2030

Veda Mathur, IX-H, AISG46, Gurugram

My vision for the World of 2030 sees opportunities, challenges and scope for innovation.

With the advancement in technology, the next 5 years will also see its increased adoption: Almost everyone with a smartphone or computer will be using AI.

Schools will be of another level! There will be various new gadgets to help students study better and smarter. There will be robot teachers in place of regular teachers, especially in the areas of science, technology, medicine, space and architecture. We will have cleaner cities, because Waste Detection and Classification AI will take care of the trash and dispose it in the correct dustbins.

However, we will need to be careful too, to not let AI take over the world completely. We will also need to be physically more active and remain curious about the world around us, so that we don't become lazy and unmotivated. Schools will also need to be more vigilant to not let students cheat on their exams using ChatGPT and other resources without realising that they're destroying their own future!

As for me, I will help shaping the future of Earth by making sure to conserve electricity, throw the rubbish where it belongs, and encourage positivity. Ultimately, in spite of whatever technology can do to make our lives more convenient, we remain responsible to make this World a better place; not just for us, but also for future generations, always.
