

My vision for 2030

By: Sejal.Y. Bandi 12C

I hope by 2030 the world is safer, cleaner and smarter.

I hope for cities that are cleaner, greener and have excellent public transport that uses clean energy. There will be a greater effort by the public to protect the environment.

As a student of science, I wish to make inventions that help us lead easier and better lives. Smart devices, quicker ways to connect and better healthcare are all part of the coming technological growth. I think robots and artificial intelligence will be useful in healthcare, workplaces and people's homes.

Technology will help make school learning more engaging. Students in various countries will have the opportunity to learn with each other via the internet. The new model will stress creativity and building understanding.

I want to join in this new future by gaining more knowledge and sharing it to assist others.

My goal for 2030 is that people, technology and nature live in harmony. A place where we show more compassion, think on a larger scale and make the world better.
